

VERONA™

KNOWLEDGE MANAGEMENT BOOK (KMB)

Verona™ is a powerful collaborative knowledge management tool that can be used to rapidly harness corporate knowledge, organize, present, share, and distribute knowledge in timely manner.

Verona™ makes use of the familiar notebook metaphor. It allows users to easily customize and categorize their information for maximum impact. Users can quickly access diverse information from multiple distributed sources and manage them all within **Verona™** notebook. Objects dropped into **Verona™** are displayed on a page in content-specific ways and are LIVE and interactive!

Verona™ initially was designed to allow White House-level decision-making during national security crises and for intelligence community officials to collaboratively collect and present dynamic multi-media information to top-level decision makers.

Verona is inherently collaborative – users can share their knowledge book with others at both a view-sharing and data-sharing level.

For additional Information on Verona: <http://www.gitisolutions.com>

Features:

- Content centric information
- Multimedia Knowledge Management
- Notebook metaphor – chapters, pages
- Compound document with “LIVE” objects – MS Word, Excel, PowerPoint, MS Project, Audio, Video, and Web Pages management
- Built-in collaboration
- Third-party Java Applet plug-ins
- Maplicity – GIS TOOLS.
- XML from the ground up.
- Product viewable through standard browser.

LumINT

Knowledge Discovery Toolkit

LumINT™ offers a tailored set of best in class, off-the-shelf knowledge discovery and visualization components to speed up the analytical process. **LumINT™** is specifically designed in response to the explosive growth of all-source and open source data that Intelligence Community analysts face in the war on terrorism.

Delivered through the user's browser and embedded in an agent-based plug-and-play framework, **LumINT™** is designed for enterprise-wide knowledge discovery services in defense, intelligence, homeland security, and law enforcement.

LumINT™ creates new capabilities from existing technologies to address:

- searching through massive, heterogeneous, unstructured, semi structured, structured, and multimedia data
- identifying complex, time-critical patterns
- evolving assumptions and “what-if” scenarios

Features:

- Federated multi-media search with name variance and a choice of search result visualization tools
- Search profile capability and result set comparison
- Document analysis using semantic relationships
- Seamless document content transformation into link analysis charts using entity extraction
- Imagery and mapping tools
- Foreign language machine translation
- Notebook to organize and present intelligence analysis
- Plug-and-play agent-based knowledge discovery framework enabling incorporation of 3rd party components
- Dynamic portal configuration of organization-level and user-level services and data sources

Benefits:

- Innovative solution speeds up the analytical process, while providing thorough data analysis and allows more time for analysis
